

Optical Properties of Solids (2nd Revised edition)

By Mark Fox

Oxford University Press. Paperback. Book Condition: new. BRAND NEW, Optical Properties of Solids (2nd Revised edition), Mark Fox, The second edition of this successful textbook provides an up-todate account of the optical physics of solid state materials. The basic principles of absorption, reflection, luminescence, and light scattering are covered for a wide range of materials, including insulators, semiconductors and metals. The text starts with a review of classical optics, and then moves on to the treatment of optical transition rates by quantum theory. In addition to the traditional discussion of crystalline materials, glasses and molecular solids are also covered. The first edition included a number of subjects that are not normally covered in standard texts, notably semiconductor quantum wells, molecular materials, vibronic solid state lasers, and nonlinear optics. The basic structure of the second edition is unchanged, but all of the chapters have been updated and improved. Futhermore, a number of important new topics have been added, including: * Optical control of spin * Quantum dots * Plasmonics * Negative refraction * Carbon nanostructures (graphene, nanotubes and fullerenes) * NV centres in diamond The text is aimed at final year undergraduates, masters students and researchers. It is mainly written for...

Reviews

An exceptional ebook along with the typeface applied was intriguing to read. It is definitely simplistic but unexpected situations within the fifty percent of the publication. You are going to like just how the writer publish this pdf. -- Adeline O'Kon

This is the very best publication we have read through right up until now. It is one of the most incredible book we have read through. Once you begin to read the book, it is extremely difficult to leave it before concluding. -- Miss Celia Volkman
